

AquaTight® with Optional SignalTight® | 59/6 Series - "XL" Extended Body

1 Cut the cable squarely.

2 Using a fixed blade with a prep tool in good condition, prepare the cable to 5/16" x 1/4" x 1/4" dimensions. Use the edge of the tool if there is no stop.

3 Fold back the braid. If using tri-shield or quad-shield cables, remove the additional foil layer and fold back the remaining braid.

4 Ensure the cable is prepared to the proper dimensions.

5 Use the gauge on the VT tool to check the dimension of the center conductor.

6 Guide the center conductor and dielectric into the connector post. Insert the cable into the connector until the dielectric is flush within the post.

7 Here you can see the dielectric is flush within the post.

8 Properly seat the connector in the VT tool and fully compress it.

9 Install the connector onto the port and tighten to recommended torque.
